

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph [0022] on page 5 of the specification with the following amended paragraph:

[0022] The outer shell 12 is preferably constructed of a non-porous, flexible, biocompatible material, such as silicone elastomer. The outer shell 12 has a wall of sufficient thickness to provide structural integrity to retain fluids while achieving the desired flexibility and malleability of the implant 10a. The outer shell 12 is substantially oval-shaped, with the top of the implant 10a having a convex shape, as oriented in the drawings. Thus, the shape of the implant 10a is defined by the overall external shape of the outer shell 12. In an exemplary embodiment, the enclosed volume within the outer shell 12 is 375 cc. Therefore, the outer shell 12 may accommodate say ~~300~~ 375 cc of volume-displacing material, e.g., fluid and fitted shells. It is to be understood that various other volumes of shells 12 may be utilized.
